

# PROJECT: BUILD YOUR OWN PC

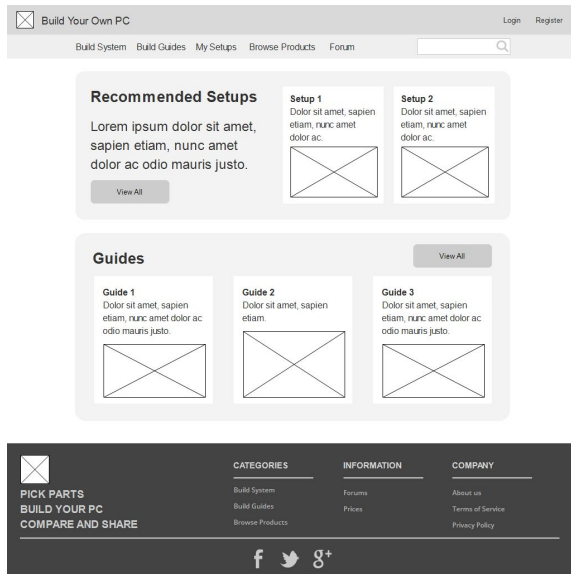

## INTRODUCTION

With the fast evolution of technology and the wide variety of alternatives that we have in the market, choosing a customized setup for a desktop computer becomes an almost titanic task for someone who is not involved in the world of technology. So, this is why I intend to create a website that can help to create the most appropriate setup for each user, from the most inexperienced to the most experienced one, taking into account the use that will be given to the desktop computer.

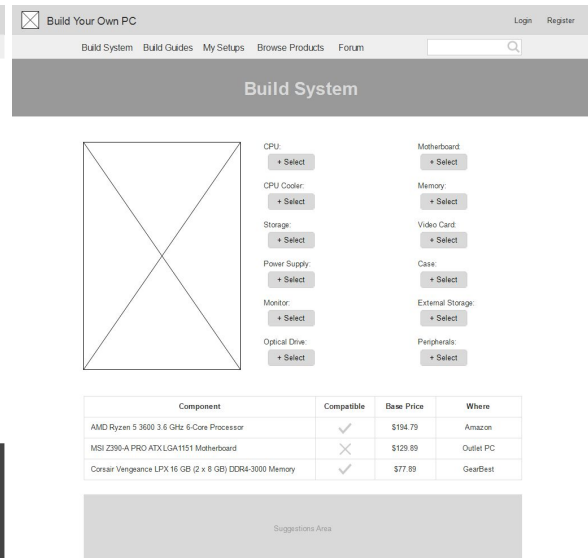

Mainly the proposed tool is a consumer aid that allows you to make a selection of components for a desktop computer, with the help of a system of suggestions and verified setups, which will allow better configurations between components. In addition, users will be available to beginner tutorials on how to assemble a desktop from scratch, how to perform hardware updates, and others. At the end or during the selection process the user can check prices of the components in sales platforms such as Amazon.

Some extra features are, for example, being able to login to the system and manage personal setups, in addition to sharing them with the community.

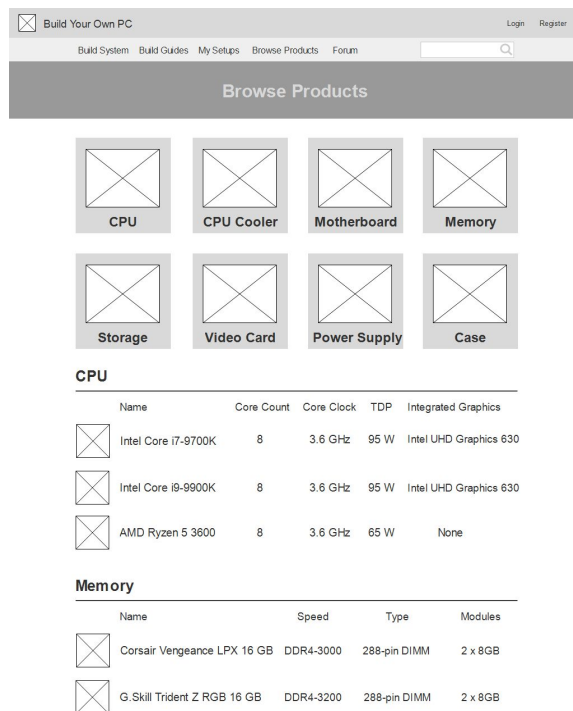

# USER INTERFACE DESIGN AND PROTOTYPE

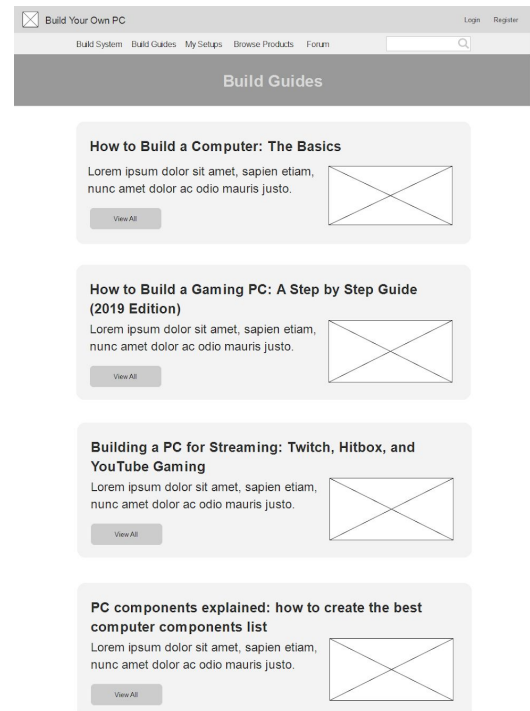

Main

Build System

Browse Products

Build Guides

The objective of this graphic user interface design is to provide an intuitive and friendly interaction, without forgetting that it can support the raised features.

Within these 4 user interfaces, we can find the Build System with the embedded Suggestion System, the Product Search engine and the Build Guides.

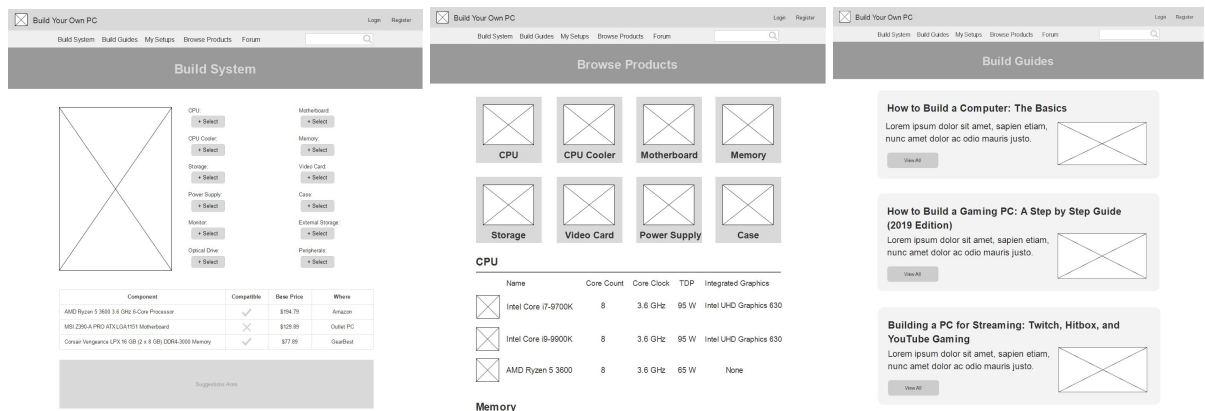

## NAVIGATION STRUCTURE

With respect to the navigation structure, it has been decided to use a simple navigation bar, breadcrumbs and sometimes in more specific cases accordions.

From the next navigation bar we can access the main features of the system.

The same navigation bar can be found in each of the windows available to the system, that is, we can access anywhere from anywhere.
